PhD dissertation

title | *Detection and characterization of critical transitions in mitochondrial activity via high content screening*

supervisors | Prof. Dr Rudi Balling and Dr Paul Antony

description | Critical transitions exist in many dynamical systems, ranging from the Earth's climate system to microcosm populations. During a critical transition, the state of a dynamical system abruptly changes from one stable state to another, typically without obvious prior warning. In this thesis, we set out to study critical transitions in a simple cellular model using mitochondrial membrane potential as readout. To identify critical transitions, we established a modular high-content screening platform allowing systematic perturbation of oxidative phosphorylation. We showed that critical transitions are an intrinsic property of cellular systems and that two-component Gaussian mixture models adequately describe critical transitions dynamics.

Master thesis

title | *Secure integration of wireless sensor networks into application*

supervisors | Prof. Jean-Pierre Hubaux and Laurent Gomez

description	Performed a risk analysis on integrating wireless sensor networks with business applications using NIST SP 800-30. We analyzed a security scheme which does not rely on complex operations guaranteeing end-to-end confidentiality of sensor data and provided both an *in silico* software demonstration and a hardware validation using physical components.
